SOFTWARE FOR THE SMALL BUSINESS OFFICE

Build around the work that happens every day.

OverHead brings customer records, tasks, quotes, invoices, and approvals into an installed Windows workspace.

The target buyer is the owner of a small service business: close to the customer, responsible for the team, and still carrying too much of the office in their head.

THE PROBLEM

Scattered context.

Notes, inboxes, and separate tools make routine follow-up harder to track.

THE ENTRY POINT

One recurring job.

Start with customer follow-through and expand as teams use the workspace.

THE MODEL

Tiered access.

Silver, Gold, and Black support increasing individual workspace needs. Cylinder is the separate department deployment.

The adoption thesis

Win a useful daily routine first. Measure whether teams return, complete work, and choose to keep using the product before expanding the scope.

WHAT CAN BE INSPECTED TODAY

A downloadable product with a defined next step.

Area	Current scope
Shared UX	Search and command palette, quick create, action inbox, keyboard navigation, accessible comfort controls, work planning, and reviewed bulk status updates.
Desktop	Individual-user app for standard Windows 10/11. The core workflows run without Cylinder department-level management.
Cylinder Server	Department host for supported Windows Server/IoT. Adds central employee Ranks, departments, devices, and OverHead access policy.
Cylinder Client	Managed Windows 10/11 workstation or remote desktop endpoint. Shares daily workflows and follows the department policy; it is not an administrator surface.
Data boundary	Documents and local records remain on the configured machine unless explicitly synced or exported. Central identity/device policy does not replicate business files.

CURRENT PRODUCT SCOPE

Desktop + Cylinder 0.3.24

The current work carries shared UX and backend treatment across all three package variants. Package signing and live publication remain separate release checks before distribution.

NEXT OPERATIONAL MILESTONE

Activate and verify billing

Live Stripe checkout is not enabled. Server configuration and an end-to-end payment test are required before paid self-service activation.

Evidence should stay specific.

Release checks demonstrate defined software behavior and artifact delivery. They do not establish customer adoption, retention, revenue, or commercial security certification.

Release status, signing, billing activation, live update behavior, and customer adoption should be verified separately. Cylinder has distinct Server and Client packages, policies, data locations, and commercial terms.

COMMERCIAL VALIDATION PLAN

Measure adoption before widening the product.

01 / TARGET

Choose one office segment.

Recruit a small group with a repeated customer follow-up problem. Define the buyer, current tools, and switching friction.

02 / ACTIVATE

Get to the first useful result.

Measure account setup, the first customer record, and the first completed workflow. Record where onboarding stalls.

03 / RETAIN

Watch repeat use.

Track weekly active workspaces, completed work, support demand, and why teams continue or stop.

04 / CONVERT

Test willingness to pay.

After billing is enabled and verified, measure trial-to-paid conversion, renewal, and the cost of supporting each account.

Priorities that support that plan

Complete payment-service setup, establish trusted Windows signing, simplify onboarding, and run a focused pilot. Expand integrations only where pilot evidence supports the work.

A USEFUL NEXT CONVERSATION

Review the product, its deployment requirements, and a measurable pilot plan.

Customer traction, revenue, valuation, fundraising amount, and investment terms are not asserted in this brochure.
