

MARKET RESEARCH AND GUARDED EXECUTION FOR LINUX

Observe activity. Execute by rule.

Timmy combines market scanning, trade planning, paper practice, and broker-connected order controls in one native desktop workflow.

01 / DISCOVER
Monitor a configured market universe for daily movement and strategy context.

02 / EVALUATE
Review proposed orders, sizing, account status, and risk controls.

03 / REVIEW
Retain local records of simulation, execution, and broker outcomes.

DESKTOP PRODUCT OVERVIEW

Stocks & ETFs first · Optional Webull connection

OPERATING FRAMEWORK

From discovery to reviewable action.

Timmy makes each stage of its workflow inspectable. It can scan markets and prepare plans; the operator configures accounts, selects an execution lane, and controls whether an order is submitted.

1 **Configure locally**

Set market and execution preferences in the desktop application. Broker credentials remain in the local profile.

2 **Screen and review**

Examine candidate symbols, data quality, strategy context, and the reasons a plan is ready or blocked.

3 **Assess the proposed order**

Review entry, stop, target, quantity, account state, and configured exposure limits before proceeding.

4 **Select an execution lane**

Paper and Simulation record local outcomes. Live requires account verification, broker permissions, market eligibility, and explicit safety settings.

◌

Market discovery

Surfaces configured symbols with notable daily movement and strategy context.

⌁

Risk-aware planning

Applies configured quantity, notional, per-trade, and account-cash limits.

▤

Local records

Separates paper, simulation, and execution events for later review.

⌖

Broker verification

Supports Webull account checks and exact order-preview workflows.

⌘

Operational controls

Shows account readiness, safety gates, and reasons an action is unavailable.

◷

Auditable activity

Retains submission outcomes and safety events for operator follow-up.

OPERATOR AUTHORITY

Three lanes. Distinct records.

PAPER · LOCAL LEDGER

Record simulated orders and outcomes in the local paper ledger. These records are not broker-confirmed positions or returns.

SIMULATION · SCENARIO RECORD

Evaluate proposed plans through local preview and submission controls. Outcomes use daily candles and do not model broker fills or market microstructure.

LIVE · BROKER ORDERS

Submit real orders only after account verification, exact order preview, configured exposure and drawdown limits, and all applicable Timmy and broker checks.

Automation remains inspectable. Timmy organizes market information and applies configured checks. It cannot assess every aspect of an operator's financial circumstances or guarantee an outcome.

Platform

Native Linux desktop application

Primary coverage

U.S. stocks, ETFs, and index proxies by default

Broker workflow

Optional Webull OpenAPI account check and guarded order flow

Data and records

Local application configuration and execution journal

FURTHER INFORMATION

Understand the workflow. Review live prerequisites.

Consult the setup guide, execution-lane descriptions, and operating limits before connecting an account.
