T **TIMMY** BY BLACK LION STUDIOS

A GUARDED TRADING DESK FOR LINUX

Watch the market. Keep your rules.

Timmy brings scanning, trade planning, paper practice, and guarded execution controls into one native desktop workflow.

01 / DISCOVER
Scan a focused market universe for movement and setups.

02 / REVIEW
Inspect plans, sizing, cash checks, and risk gates.

03 / RECORD
Keep a local event journal for review and follow-through.

DESKTOP PRODUCT OVERVIEW

Stocks & ETFs first · Optional Webull connection

A CLEAR OPERATING RHYTHM

From watchlist to review.

Timmy is built to make each step visible. It can scan and prepare plans, but users stay in control of account setup, lane selection, and whether an order is ever submitted.

1 **Set up locally**

Configure market preferences in the desktop app. Webull credentials, if used, are entered locally and are not sent to this website.

2 **Scan and inspect**

Review active symbols, setup context, data quality, and the reasons a plan may be ready, watch-only, or blocked.

3 **Check the plan**

Inspect the proposed entry, stop, target, quantity, and configured exposure limits before proceeding.

4 **Choose a lane**

Use Paper to record simulated outcomes. Live remains gated by account checks, broker permissions, market rules, and explicit settings.

Market scanning

Focuses attention on symbols with notable movement and strategy context.

Risk-aware plans

Applies configured quantity, notional, per-trade, and account-cash limits.

Local journal

Records paper and execution events so users can review outcomes and data quality.

Broker checks

Supports guarded Webull account verification and order preview workflows.

Operator controls

Shows readiness, safety gates, and reasons an action is unavailable.

Reviewable activity

Provides a record of submissions, outcomes, and guardrail events for follow-up.

CONTROL STAYS WITH THE USER

Two lanes. Separate records.

PAPER · SIMULATED

Practice the workflow and review simulated results in Timmy's local journal. Simulated outcomes may differ from real execution and do not establish what a live account would have earned.

LIVE · BROKER GUARDED

Live order placement is disabled by default. It requires explicit settings, a verified supported account path, buying power, market eligibility, and the relevant Timmy and broker gates.

Designed for review, not blind trust. Timmy can organize market information and apply configured checks. It does not know your complete financial circumstances and cannot guarantee a result.

Platform

Native Linux desktop application

Primary coverage

U.S. stocks, ETFs, and index proxies by default

Broker workflow

Optional Webull OpenAPI account check and guarded order flow

Data and records

Local application configuration and execution journal

EXPLORE TIMMY

Start with the guide.
Keep live locked until ready.

Read setup instructions, understand the lane controls, and review the operating limits before connecting an account.
